

Write-up for Website initial HTML

Jenna Wynd, Daphne Kalkanis, Hammad Gondal, Winston Weiler

Description: The Online Learners' website will encompass a variety of tips and tricks in topics of online learning for students and teachers. It will be designed in a follow along guide format in order to better understand eLearning. Furthermore, its purpose is to provide people with better ways to manage online classes. From plans to advice, our website will present strategic ways to have a less stressful "new normal" educational journey. Our platform will take into account both learners and educators in order to make the most out of all participants' roles in all aspects of remote learning. The main goal is for viewers to have a more effective online learning experience and become more individually successful throughout their virtual education.

HTML elements utilized and design: In our web page design, we as a group used fonts provided by google api. In addition, we used div and specified their function with the class element of the tag. We included a section labeled "infoandpics" which included a description of the website, in addition to custom designed icons put together by Jenna in Adobe Illustrator. We then added a link tag to attach the homepage to the "choose.html" page. On the subsequent page, we added a choice for student and teacher along with logos. These links attached to teacher and student pages which gave advice for the individual specified respectively.

What we hope to implement in the future: While we have very much of the "bare-bones HTML," we plan to add significant CSS to make the website look more presentable in addition to a carousel for the different picture and captions of advice for students and teachers, respectfully.
